

BARRIER

FOR THE PROTECTION OF ENDANGERED WILDLIFE

Regulation of public use for the conservation of endangered species

Endangered species that live in mountains, such as the capercaillie, despite being adapted to withstand harsh winter conditions, need maximum tranquility. During winter, food is scarce and low in energy, and any movement involves losing vital energy.

Repeated escapes caused by human presence can have serious consequences, to the point of inhibiting reproduction or endangering survival by depleting energy reserves.

Help them by not entering the protection zones.

GIVE THEM THE PEACE AND QUIET THEY NEED

It is the responsibility of each one to know the current legislation regarding the conservation of nature, according to which it is prohibited to intentionally disturb wild animals.

Respectful mountain practices

Obey signs and regulatory infrastructures. They are there to guarantee nature conservation.

Do not leave signposted itineraries and main paths.

Animals avoid these areas and remain calm in areas without trails.

In areas with capercaillie, move through open areas avoiding crossing the forest and without approaching its limits. The capercaillie is very sensitive to human presence.

Always keep dogs on a leash. Loose dogs scare wild animals away and are potential predators.

Move together as a single group and don't speak loud. Silence prevents disturbing the fauna that lives in the proximity of the paths.
